Introduction

Pages 3-4 Introduction to More Equitable Democracy, the organization which prepared these charts and maps and Cal RCV

Section 1: Executive Summary

Page 5 Explanation of Redistricting Simulation Methodology

Page 5 Summary of Simulation Results, comparing Single-Member Districts and Multi-Member Districts

Page 6 Summary of Data, Estimated Representation by Race by District Plan, comparing Single-Member Districts and Multi-Member districts

Section 2: Single-member districts analysis

Pages 8-22 Analysis of 33 single-member districts

Pages 23-33 Analysis of 31 single-member districts

Pages 34- 43 Analysis of 27 single-member districts

Pages 45-59 Analysis of 25 single-member districts

Pages 60-70 Analysis of 23 single-member districts

Section 3: Multi-member districts analysis

Pages 71-89 Analysis of eleven three-seat districts, total of 33 seats

Pages 90-109 Analysis of nine three-seat districts, total of 27 seats

We're a diverse, nonpartisan coalition of Californians dedicated to bringing the benefits of RCV to every voter in our state. We combine research and education with grassroots organizing to build a movement that is inclusive, effective, and enduring.

Mission: To expand the use of RCV to all Californians to ensure we have a greater voice in our democracy.

CalRCV
Better Elections. Better Democracy.

Mission: Advance racial equity by transforming electoral systems.

Vision: An inclusive, multi-racial democracy liberated from systemic racism

What we do: We support communities of color to advocate for transformative systems changes in order to achieve a more racially just democracy

Redistricting Simulation Methodology

- We used **GerryChain**, a redistricting simulation tool developed by the Metric Geometry and Gerrymandering Group (MGGG).
- The tool uses **ReCom (Recombination)**, a standard academic method that generates thousands of legally valid maps **without optimizing for political or demographic outcomes**.
- For each plan, we generated **10,000 random maps** to establish a neutral baseline for Los Angeles.
- We used the **average and mode** of these simulations to estimate expected representation by race using **Citizen Voting Age Population (CVAP)**. CVAP is the number of persons who are U.S. citizens and at least 18 years of age. At the request of the Department of Justice, the U.S. Census Bureau publishes an annual [\(CVAP\) by Race and Ethnicity](#) special tabulation, based upon either the most recent [Decennial Census](#) or the American Community Survey [5-year estimates](#).

District Definitions

- **Single-Member Districts:**
 - *Solid:* $\geq 45\%$ CVAP | *Influence:* 35–45% CVAP
- **Three-Member Districts:**
 - *Solid:* $\geq 25\%$ CVAP | *Influence:* 15–25% CVAP

The following slides shows the **Summary of Simulation Results**, comparing **Single-Member Districts of 21, 23, 25, 27, 31 and 33 seats** to **nine and 11 Multi-Member Districts of 27 seats (nine three-seats districts) and 33 seats (11 three-seat districts)**

- We averaged results from **10,000 simulated maps** across multiple district structures, including **Single-Member Districts (SMDs)** and **Multi-Member Districts (MMDs)**.
- **Single-Member Districts consistently limit minority influence:**
 - **API voters** have *at most* influence over **1 seat** under SMDs—and often none.
 - **Black voters** have *at most* influence over **2 seats** under SMDs.
- **Multi-Member Districts substantially increase representation:**
 - **API voters** are likely to influence **4–5 seats** under MMDs.
 - **Black voters** are likely to influence **3–4 seats** under MMDs.
- **Latino and White representation remains relatively stable** across SMD and MMD plans.

Bottom line: Multi-Member Districts consistently produce outcomes that better reflect Los Angeles’ demographic and political diversity, while Single-Member Districts systematically constrain representation for minority and non-majority groups.

Summary of Data

Estimated Representation by Race by District Plan

	AAPI Seats <i>(Influence + Solid)</i>	Black Seats <i>(Influence + Solid)</i>	Latino Seats <i>(Influence + Solid)</i>	White Seats <i>(Influence + Solid)</i>
33 * 1 SMD	0/33 <i>(0 + 0)</i>	2/33 <i>(1 + 1)</i>	18/33 <i>(7 + 11)</i>	15/33 <i>(4 + 11)</i>
31 * 1 SMD	0/31 <i>(0 + 0)</i>	2/31 <i>(0 + 2)</i>	17/31 <i>(6 + 11)</i>	14/31 <i>(4 + 10)</i>
29 * 1 SMD	0/29 <i>(0 + 0)</i>	3/29 <i>(1 + 2)</i>	16/29 <i>(6 + 10)</i>	14/29 <i>(4 + 10)</i>
27 * 1 SMD	0/27 <i>(0 + 0)</i>	2/27 <i>(1 + 1)</i>	15/27 <i>(5 + 10)</i>	12/27 <i>(4 + 8)</i>
25 * 1 SMD	0/25 <i>(0 + 0)</i>	2/25 <i>(1 + 1)</i>	14/25 <i>(5 + 9)</i>	11/25 <i>(4 + 7)</i>
23 * 1 SMD	0/23 <i>(0 + 0)</i>	2/23 <i>(1 + 1)</i>	13/23 <i>(6 + 7)</i>	11/23 <i>(4 + 7)</i>
11 * 3 MMD	5/33 <i>(5 + 0)</i>	4/33 <i>(3 + 1)</i>	17/33 <i>(5 + 12)</i>	15/33 <i>(5 + 10)</i>
9 * 3 MMD	4/27 <i>(3 + 0)</i>	3/27 <i>(1 + 2)</i>	9/27 <i>(2 + 7)</i>	10/27 <i>(2 + 8)</i>

ANALYSIS of 33 SMD (single-member districts)

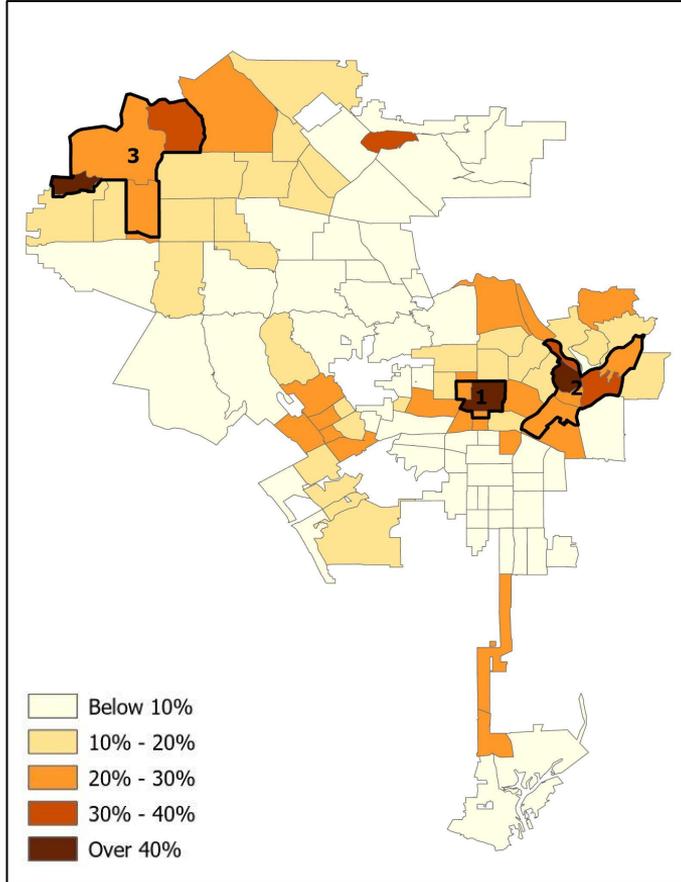

The following slide shows a map where we **manually drew three districts** to maximize **AAPI Citizen Voting Age Population (CVAP)**, while limiting neighborhood splits to **no more than one**.

Even under this intentionally favorable scenario, the **highest AAPI CVAP achieved in any single district is 41%**. All three districts also contain **substantial Latino and/or White CVAP**, meaning AAPI voters would **not be guaranteed the ability to elect a candidate of choice** even in a highly optimized map.

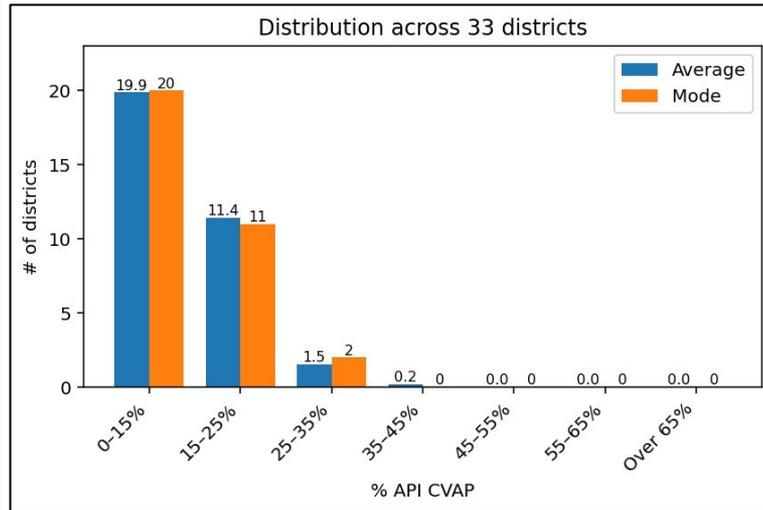

This illustrates a fundamental limitation of **Single-Member Districts**: even deliberate line-drawing cannot reliably produce districts where AAPI voters have decisive electoral power. **Multi-Member Districts** better reflect AAPI voting strength and provide more realistic opportunities for representation.

33 SMD: Maximum AAPI Representation

% AAPI CVAP by Neighborhood (Asia-Pacific Islander.)

Dist.	AAPI CVAP	Black CVAP	Latino CVAP	White CVAP	Neighborhoods <i>* Neighborhood is Split</i>
1	41%	10%	30%	18%	Koreatown, Windsor Square, Harvard Heights*
2	30%	13%	33%	22%	Elysian Park, Elysian Valley, Chinatown, Lincoln Heights, Montecito Heights, Downtown*
3	24%	7%	26%	42%	Porter Ranch, Chatsworth, Chatsworth Reservoir, Winnetka*

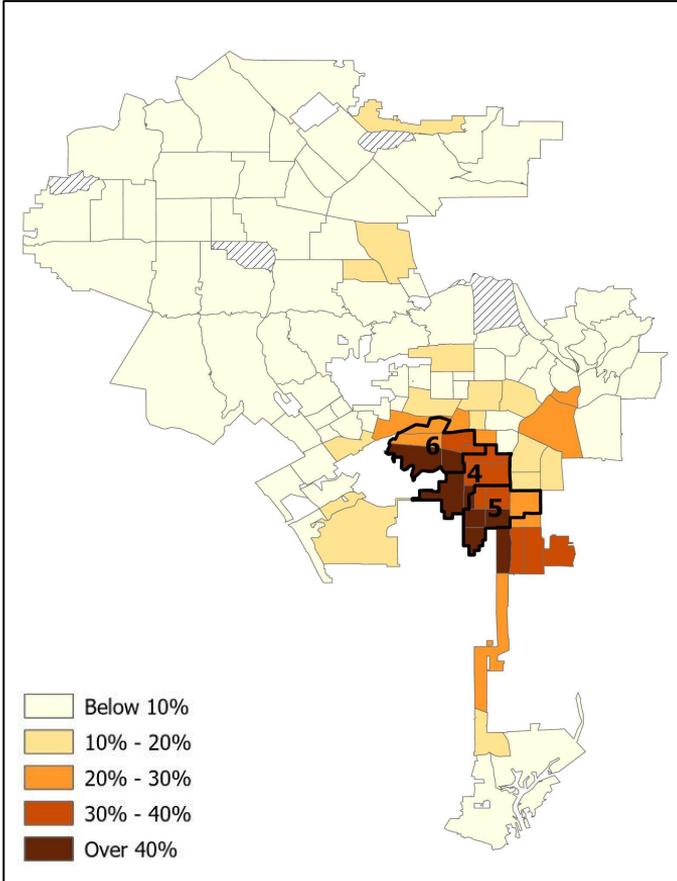

The following slide shows a map where we **manually drew three districts** to maximize **Black Citizen Voting Age Population (CVAP) between the three districts evenly**, while limiting neighborhood splits to **no more than two**.

Even under this intentionally favorable scenario, the **highest Black CVAP achieved in any single district is 46%**. All three districts also contain **substantial Latino CVAP**, meaning Black voters would **not be guaranteed the ability to elect a candidate of choice** even in a highly optimized map.

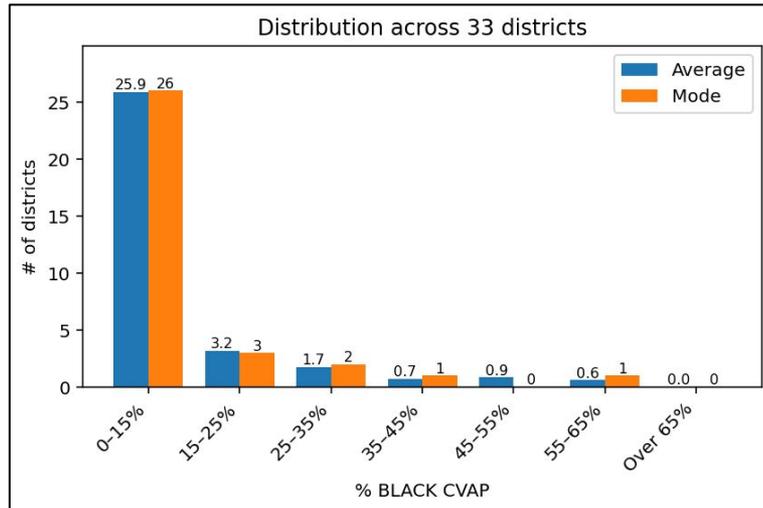

This illustrates a fundamental limitation of **Single-Member Districts**: even deliberate line-drawing cannot reliably produce districts where Black voters have decisive electoral power. **Multi-Member Districts** better reflect Black voting strength and provide more realistic opportunities for representation.

33 SMD: Maximum Black Representation

% Black CVAP by Neighborhood

Dist.	AAPI CVAP	Black CVAP	Latino CVAP	White CVAP	Neighborhoods <i>* Neighborhood is Split</i>
4	4%	46%	43%	6%	Leimert Park, Baldwin Hills / Crenshaw, Jefferson Park, West Adams, Mid-City*, Exposition Park*
5	1%	46%	50%	2%	Vermont Square, Hyde Park, Chesterfield Square*, Exposition Park*
6	5%	46%	36%	12%	Gramercy Park, Manchester Square, Vermont Knolls, Vermont-Slauson, Harvard Park, Chesterfield Square*, Florence*

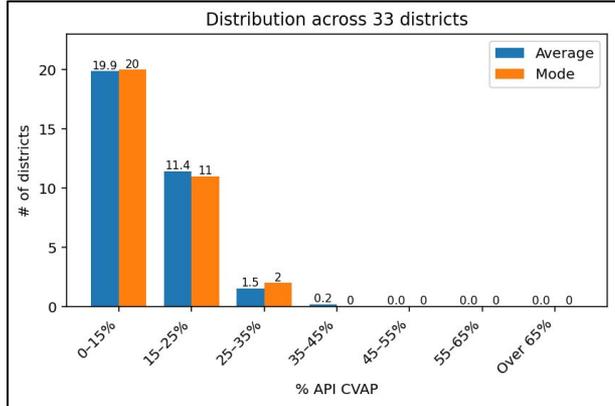

The following slide summarizes results from **10,000 randomly simulated maps** generated using **GerryChain**, showing the **average distribution of representation by race**.

Applying our definitions—**45%+ CVAP as a “solid” seat** and **35%–45% CVAP as an “influence” seat**—the chart estimates **racial influence under an average 33–district Single-Member District (SMD) plan**. The results **highlight the structural limitations of SMDs for AAPI and Black communities in Los Angeles, where winner-take-all, zero-sum elections constrain opportunities for representation even when meaningful population shares exist**.

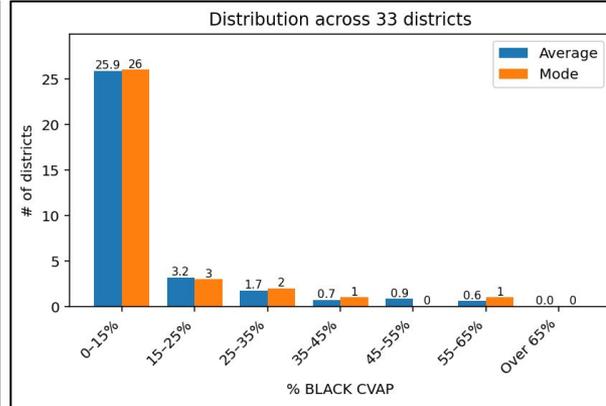

CVAP Distribution by Race: 33 SMD

ANALYSIS of 31 SMD (single-member districts)

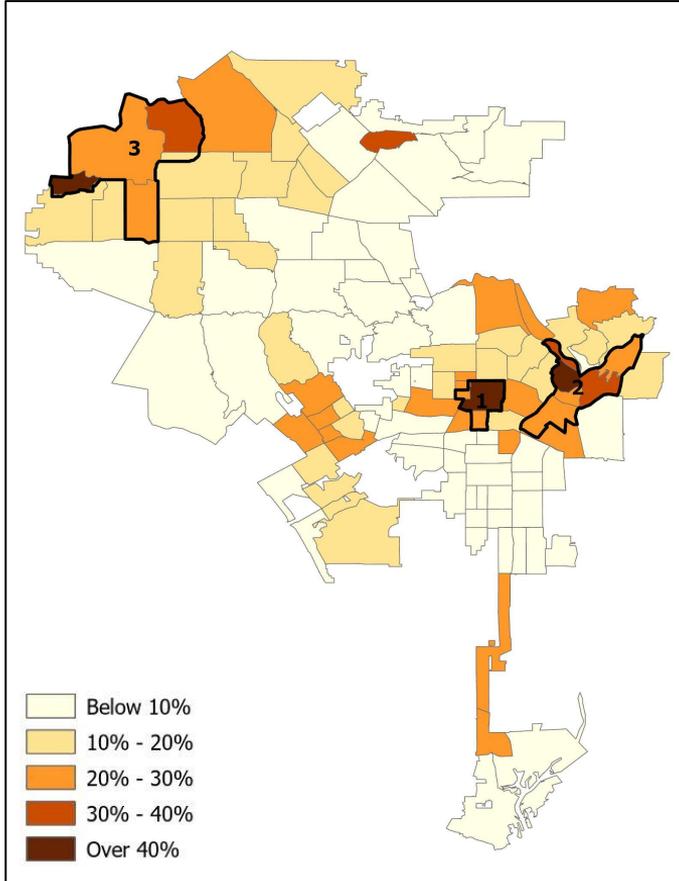

The following slide shows a map where we **manually drew three districts** to maximize **AAPI Citizen Voting Age Population (CVAP)**, while limiting neighborhood splits to **no more than one**.

Even under this intentionally favorable scenario, the **highest AAPI CVAP achieved in any single district is 39%**. All three districts also contain **substantial Latino and/or White CVAP**, meaning AAPI voters would **not be guaranteed the ability to elect a candidate of choice** even in a highly optimized map.

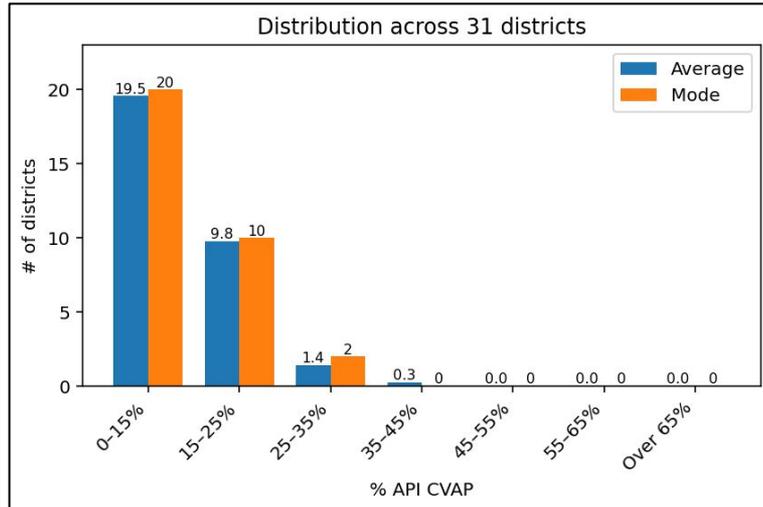

This illustrates a fundamental limitation of **Single-Member Districts**: even deliberate line-drawing cannot reliably produce districts where AAPI voters have decisive electoral power. **Multi-Member Districts** better reflect AAPI voting strength and provide more realistic opportunities for representation.

31 SMD: Maximum AAPI Representation

% AAPI CVAP by Neighborhood

Dist.	AAPI CVAP	Black CVAP	Latino CVAP	White CVAP	Neighborhoods <i>* Neighborhood is Split</i>
1	39%	11%	32%	16%	Koreatown, Harvard Heights, Windsor Square*
2	27%	16%	32%	22%	Elysian park, Elysian Valley, Chinatown, Lincoln Heights, Montecito Heights, Downtown*
3	24%	7%	26%	42%	Porter Ranch, Winnetka, Chatsworth, Chatsworth Reservoir, Northridge*

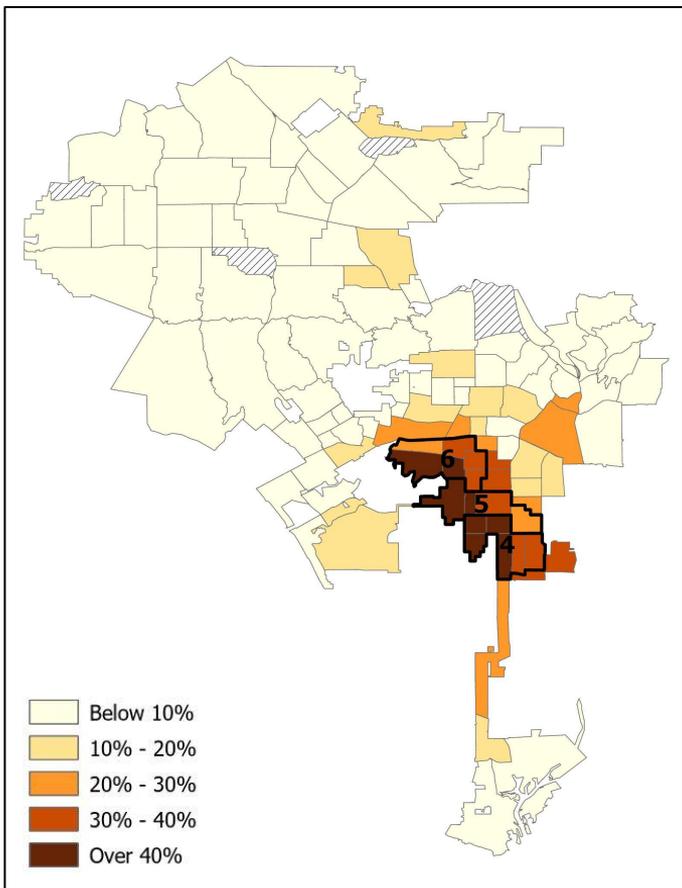

The following slide shows a map where we **manually drew three districts** to maximize **Black Citizen Voting Age Population (CVAP) between the three districts evenly**, while limiting neighborhood splits to **no more than two**.

Even under this intentionally favorable scenario, the **highest Black CVAP achieved in any single district is 49%**. All three districts also contain **substantial Latino CVAP**, meaning Black voters would **not be guaranteed the ability to elect a candidate of choice** even in a highly optimized map.

This illustrates a fundamental limitation of **Single-Member Districts**: even deliberate line-drawing cannot reliably produce districts where Black voters have decisive electoral power. **Multi-Member Districts** better reflect Black voting strength and provide more realistic opportunities for representation.

31 SMD: Maximum Black Representation

% Black CVAP by Neighborhood

Dist.	AAPI CVAP	Black CVAP	Latino CVAP	White CVAP	Neighborhoods <i>* Neighborhood is Split</i>
4	1%	49%	47%	2%	Gramercy Park, Manchester Square, Vermont Knolls, Vermont Vista, Broadway-Manchester*, Green Meadows*
5	1%	46%	48%	9%	Hyde Park, Chesterfield Square, Harvard Park, Vermont-Slauson, Florence*
6	5%	47%	38%	4%	West Adams, Baldwin Hills / Crenshaw, Leimert Park, Jefferson Park, Exposition Park*, Vermont Square*

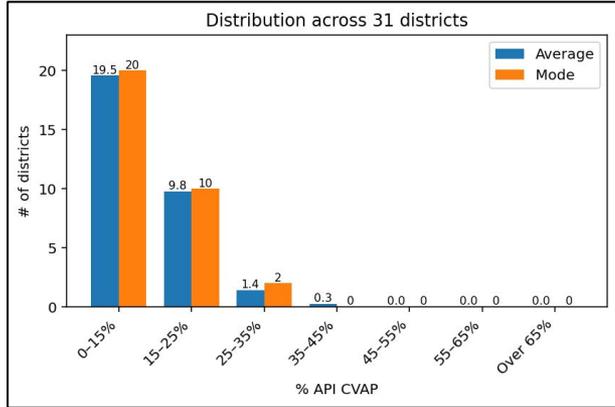

The following slide summarizes results from **10,000 randomly simulated maps** generated using **GerryChain**, showing the **average distribution of representation by race**.

Applying our definitions—**45%+ CVAP as a “solid” seat** and **35%–45% CVAP as an “influence” seat**—the chart estimates **racial influence under an average 31–district Single-Member District (SMD) plan**. The results **highlight the structural limitations of SMDs for AAPI and Black communities in Los Angeles, where winner-take-all, zero-sum elections constrain opportunities for representation even when meaningful population shares exist**.

ANALYSIS of 27 SMD (single-member districts)

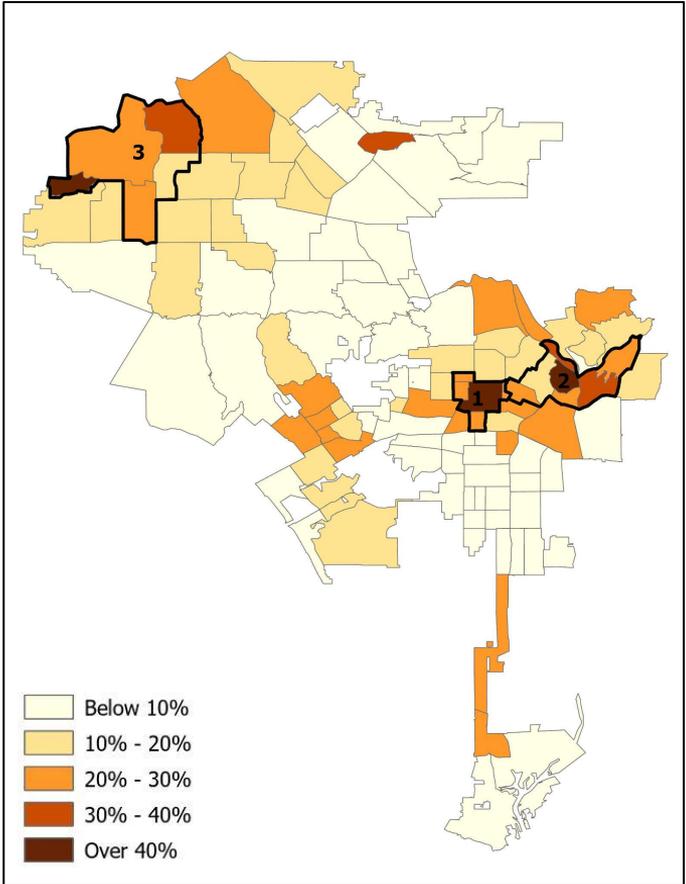

The following slide shows a map where we **manually drew three districts** to maximize **AAPI Citizen Voting Age Population (CVAP)**, while limiting neighborhood splits to **no more than one**.

Even under this intentionally favorable scenario, the **highest AAPI CVAP achieved in any single district is 38%**. All three districts also contain **substantial Latino and/or White CVAP**, meaning AAPI voters would **not be guaranteed the ability to elect a candidate of choice** even in a highly optimized map.

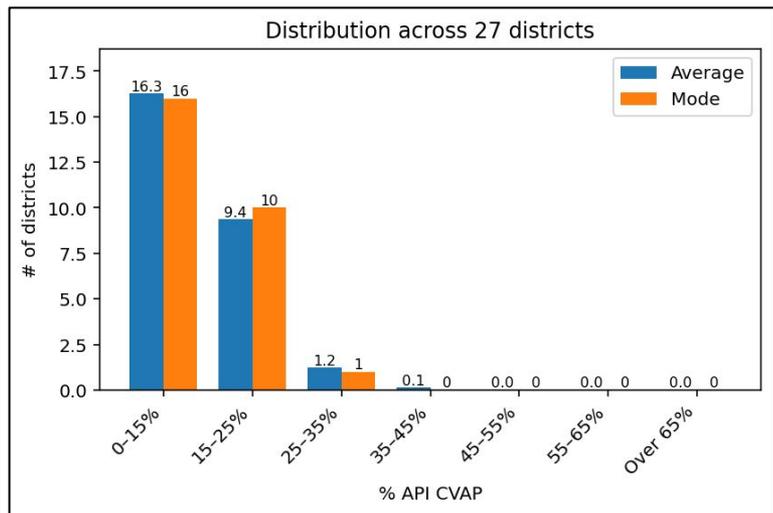

This illustrates a fundamental limitation of **Single-Member Districts**: even deliberate line-drawing cannot reliably produce districts where AAPI voters have decisive electoral power. **Multi-Member Districts** better reflect AAPI voting strength and provide more realistic opportunities for representation.

27 SMD: Maximum AAPI Representation

% AAPI CVAP by Neighborhood

Dist.	AAPI CVAP	Black CVAP	Latino CVAP	White CVAP	Neighborhoods <i>* Neighborhood is Split</i>
1	38%	10%	31%	19%	Koreatown, Harvard Heights, Windsor Square, Larchmont, Westlake*
2	25%	9%	43%	22%	Elysian Park, Elysian Valley, Chinatown, Lincoln Heights, Montecito Heights, Echo Park, Westlake*
3	24%	7%	27%	41%	Porter Ranch, Winnetka, Chatsworth, Chatsworth Reservoir, Northridge*

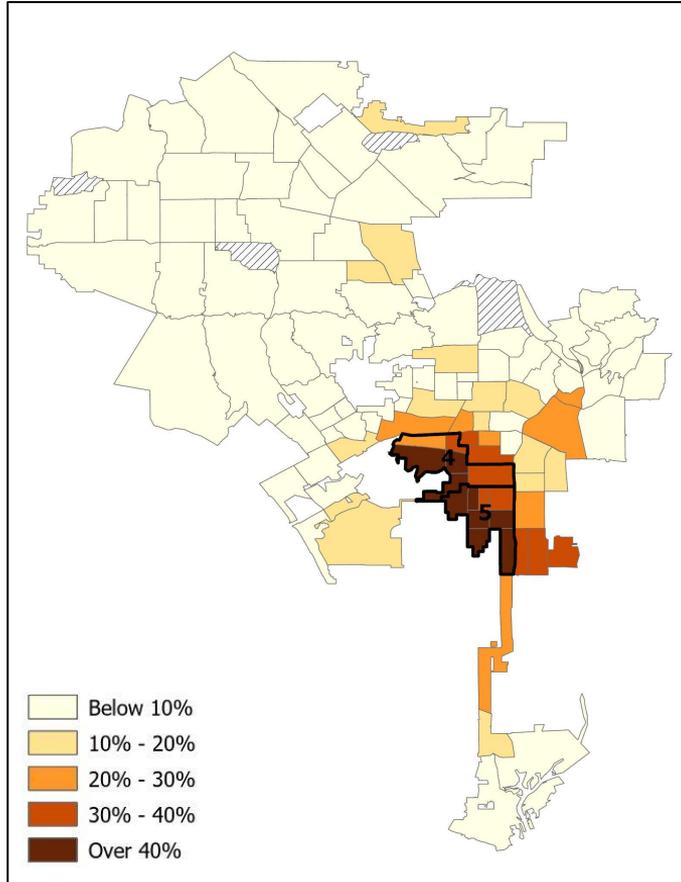

The following slide shows a map where we **manually drew two districts** to maximize **Black Citizen Voting Age Population (CVAP) between the two districts evenly**, while limiting neighborhood splits to **no more than two**.

Even under this intentionally favorable scenario, the **highest Black CVAP achieved in any single district is 52%**. All three districts also contain **substantial Latino CVAP**, meaning Black voters would **not be guaranteed the ability to elect a candidate of choice** even in a highly optimized map.

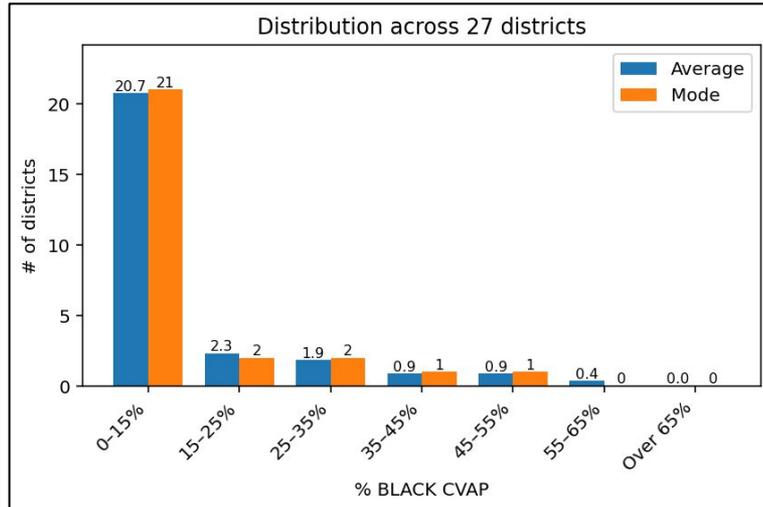

This illustrates a fundamental limitation of **Single-Member Districts**: even deliberate line-drawing cannot reliably produce districts where Black voters have decisive electoral power. **Multi-Member Districts** better reflect Black voting strength and provide more realistic opportunities for representation.

ANALYSIS of 25 SMD (single-member districts)

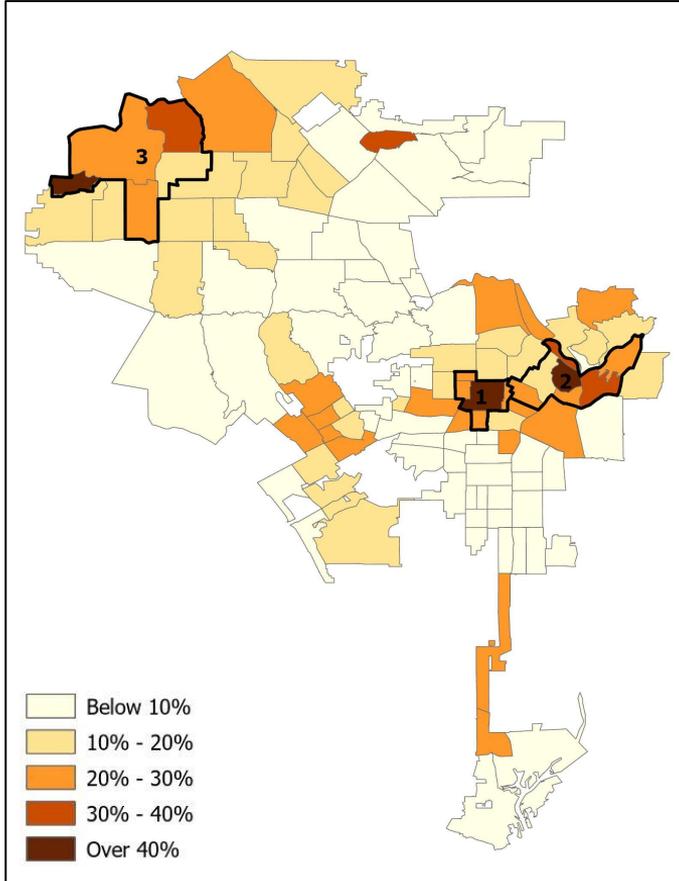

The following slide shows a map where we **manually drew three districts** to maximize **AAPI Citizen Voting Age Population (CVAP)**, while limiting neighborhood splits to **no more than one**.

Even under this intentionally favorable scenario, the **highest AAPI CVAP achieved in any single district is 37%**. All three districts also contain **substantial Latino and/or White CVAP**, meaning AAPI voters would **not be guaranteed the ability to elect a candidate of choice** even in a highly optimized map.

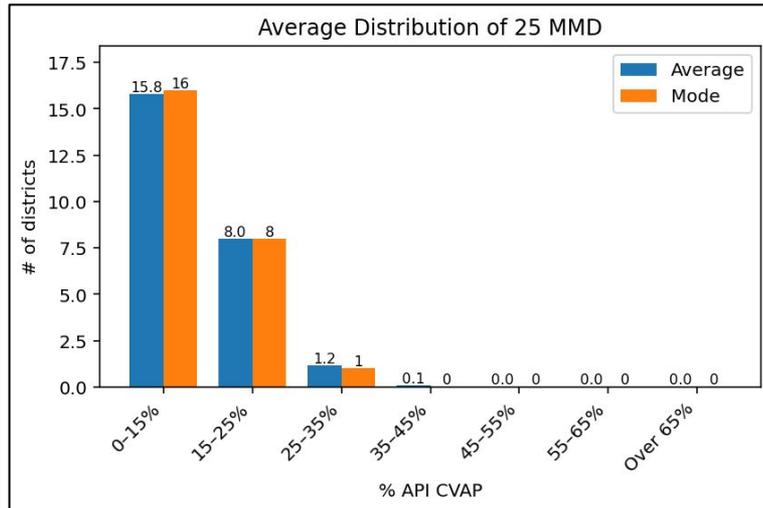

This illustrates a fundamental limitation of **Single-Member Districts**: even deliberate line-drawing cannot reliably produce districts where AAPI voters have decisive electoral power. **Multi-Member Districts** better reflect AAPI voting strength and provide more realistic opportunities for representation.

25 SMD: Maximum AAPI Representation

% AAPI CVAP by Neighborhood

Dist.	AAPI CVAP	Black CVAP	Latino CVAP	White CVAP	Neighborhoods <i>* Neighborhood is Split</i>
1	37%	10%	32%	19%	Koreatown, Harvard Heights, Windsor Square, Larchmont, Westlake*
2	25%	9%	43%	21%	Elysian Park, Elysian Valley, Chinatown, Lincoln Heights, Montecito Heights, Echo Park, Westlake*
3	23%	7%	27%	41%	Porter Ranch, Winnetka, Chatsworth, Chatsworth Reservoir, Northridge*

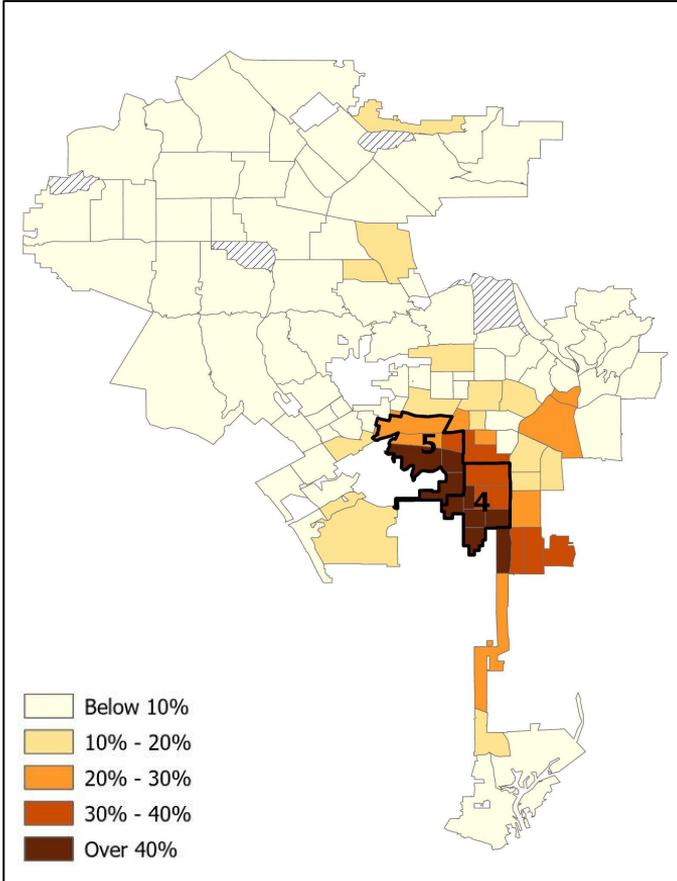

The following slide shows a map where we **manually drew two districts** to maximize **Black Citizen Voting Age Population (CVAP) between the two districts evenly**, while limiting neighborhood splits to **no more than two**.

Even under this intentionally favorable scenario, the **highest Black CVAP achieved in any single district is 48%**. All three districts also contain **substantial Latino CVAP**, meaning Black voters would **not be guaranteed the ability to elect a candidate of choice** even in a highly optimized map.

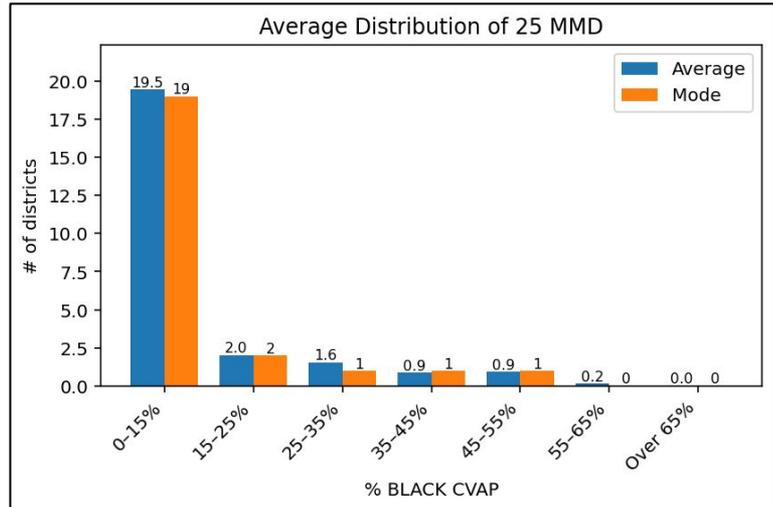

This illustrates a fundamental limitation of **Single-Member Districts**: even deliberate line-drawing cannot reliably produce districts where Black voters have decisive electoral power. **Multi-Member Districts** better reflect Black voting strength and provide more realistic opportunities for representation.

25 SMD: Maximum Black Representation

% Black CVAP by Neighborhood

Dist.	AAPI CVAP	Black CVAP	Latino CVAP	White CVAP	Neighborhoods <i>* Neighborhood is Split</i>
4	2%	48%	46%	3%	Vermont Vista, Vermont Knolls, Vermont-Slauson, Vermont Square, Harvard park, Chesterfield, Square, Manchester Square, Gramercy Park
5	6%	48%	31%	14%	Hyde Park, Leimert Park, Baldwin Hills / Crenshaw, West Adams, Jefferson Park*, Mid-City*

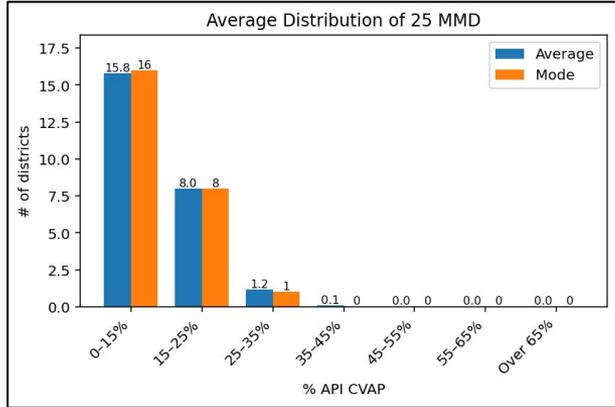

The following slide summarizes results from **10,000 randomly simulated maps** generated using **GerryChain**, showing the **average distribution of representation by race**.

Applying our definitions—**45%+ CVAP as a “solid” seat** and **35%–45% CVAP as an “influence” seat**—the chart estimates **racial influence under an average 25–district Single-Member District (SMD) plan**. The results **highlight the structural limitations of SMDs for AAPI and Black communities in Los Angeles, where winner-take-all, zero-sum elections constrain opportunities for representation even when meaningful population shares exist**.

ANALYSIS of 23 SMD (single-member districts)

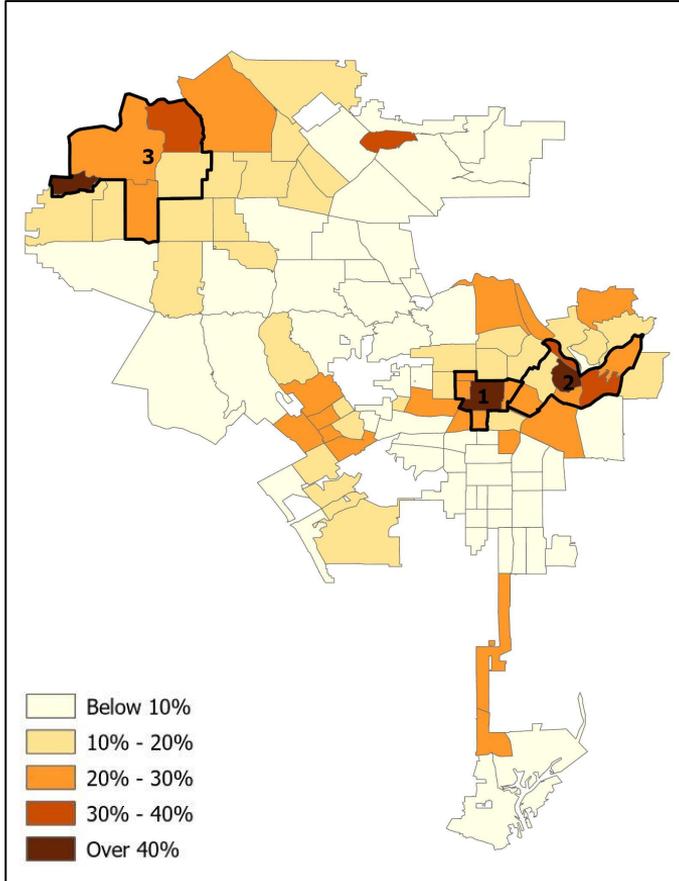

The following slide shows a map where we **manually drew three districts** to maximize **AAPI Citizen Voting Age Population (CVAP)**, while limiting neighborhood splits to **no more than one**.

Even under this intentionally favorable scenario, the **highest AAPI CVAP achieved in any single district is 36%**. All three districts also contain **substantial Latino and/or White CVAP**, meaning AAPI voters would **not be guaranteed the ability to elect a candidate of choice** even in a highly optimized map.

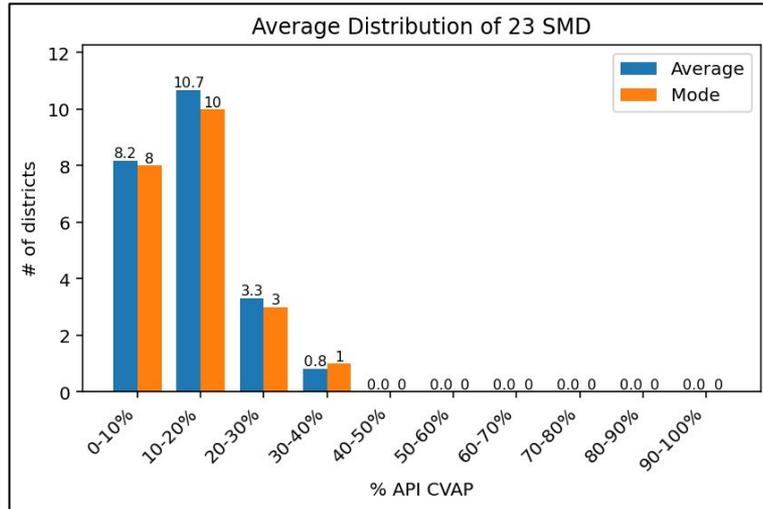

This illustrates a fundamental limitation of **Single-Member Districts**: even deliberate line-drawing cannot reliably produce districts where AAPI voters have decisive electoral power. **Multi-Member Districts** better reflect AAPI voting strength and provide more realistic opportunities for representation.

23 SMD: Maximum AAPI Representation

% AAPI CVAP by Neighborhood

Dist.	AAPI CVAP	Black CVAP	Latino CVAP	White CVAP	Neighborhoods <i>* Neighborhood is Split</i>
1	36%	10%	32%	19%	Koreatown, Harvard Heights, Windsor Square, Larchmont, Westlake*
2	24%	10%	43%	21%	Elysian Park, Elysian Valley, Chinatown, Lincoln Heights, Montecito Heights, Echo Park, Westlake*
3	23%	7%	29%	40%	Porter Ranch, Winnetka, Chatsworth, Chatsworth Reservoir, Northridge*

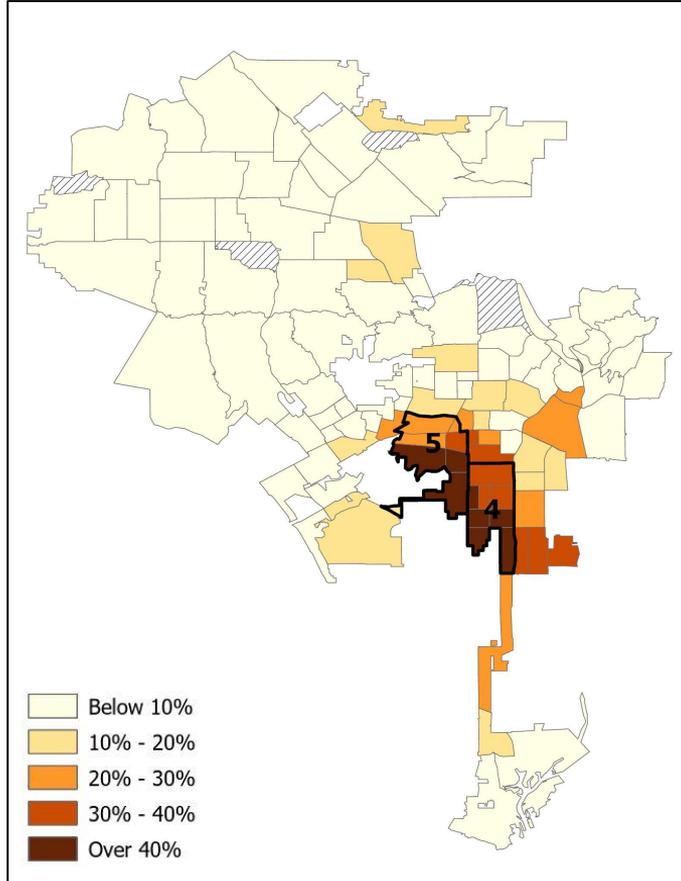

The following slide shows a map where we **manually drew two districts** to maximize **Black Citizen Voting Age Population (CVAP) between the two districts evenly**, while limiting neighborhood splits to **no more than two**.

Even under this intentionally favorable scenario, the **highest Black CVAP achieved in any single district is 50%**. All three districts also contain **substantial Latino CVAP**, meaning Black voters would **not be guaranteed the ability to elect a candidate of choice** even in a highly optimized map.

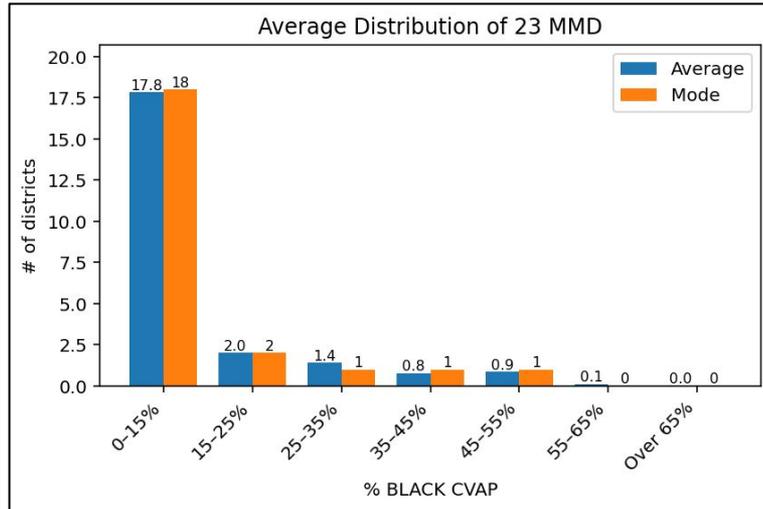

This illustrates a fundamental limitation of **Single-Member Districts**: even deliberate line-drawing cannot reliably produce districts where Black voters have decisive electoral power. **Multi-Member Districts** better reflect Black voting strength and provide more realistic opportunities for representation.

23 SMD: Maximum Black Representation

% Black CVAP by Neighborhood

Dist.	AAPI CVAP	Black CVAP	Latino CVAP	White CVAP	Neighborhoods <i>* Neighborhood is Split</i>
4	2%	46%	49%	3%	Gramercy Park, Manchester Square, Vermont Knolls, Vermont Vista, Vermont-Slauson, Harvard Park, Chesterfield Square, Vermont Square
5	6%	50%	30%	13%	Hyde Park, Leimert Park, Baldwin Hills / Crenshaw, West Adams, Mid-City*, Jefferson Park*

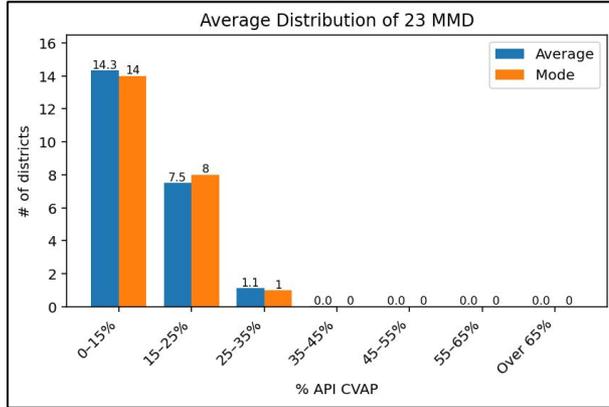

The following slide summarizes results from **10,000 randomly simulated maps** generated using **GerryChain**, showing the **average distribution of representation by race**.

Applying our definitions—**45%+ CVAP as a “solid” seat** and **35%–45% CVAP as an “influence” seat**—the chart estimates **racial influence under an average 23–district Single-Member District (SMD) plan**. The results **highlight the structural limitations of SMDs for AAPI and Black communities in Los Angeles, where winner-take-all, zero-sum elections constrain opportunities for representation even when meaningful population shares exist**.

ANALYSIS of 11 MMD (Multi-member districts)

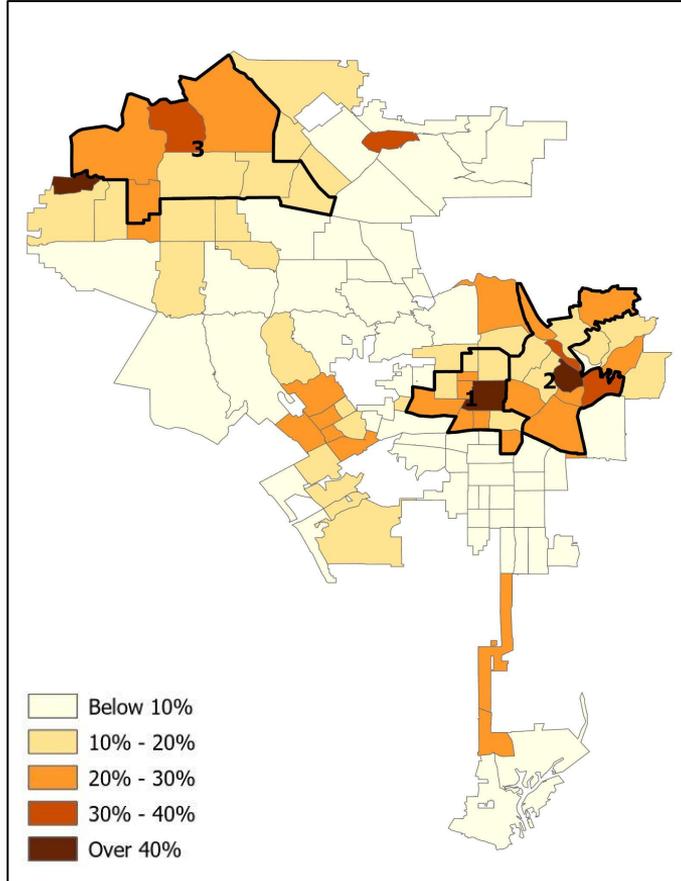

The following slide shows a map where we **manually drew three districts** to maximize **AAPI Citizen Voting Age Population (CVAP)**, while limiting neighborhood splits to **no more than one**.

Under a **Multi-Member District (MMD)** system, districts are larger but **each district elects three representatives**. Using the **Droop quota ($1 / [n + 1]$)**, a candidate needs only **25% of the vote** to be elected in a three-member district. We also define districts with **15%–25% CVAP** as **“influence” districts**.

Although these districts still include substantial Latino and/or White CVAP, **MMDs reduce winner-take-all dynamics**. Rather than a zero-sum contest, Multi-Member Districts create **meaningful opportunities for AAPI voters to elect candidates of choice**, even in diverse districts.

11 MMD: Maximum AAPI Representation

% AAPI CVAP by Neighborhood

Dist.	AAPI CVAP	Black CVAP	Latino CVAP	White CVAP	Neighborhoods <i>* Neighborhood is Split</i>
1	25%	10%	34%	29%	Koreatown, Mid-Wilshire, East Hollywood, University Park, Pico-Union, Harvard Heights, Arlington Heights, Larchmont, Hancock Park, Windsor Square, Hollywood*
2	24%	11%	35%	29%	Westlake, Eagle Rock, Lincoln Heights, Chinatown, Echo Park, Silver Lake, Glassell Park, Atwater Village, Elysian Valley, Elysian Park, Downtown*
3	20%	6%	35%	37%	Northridge, Granada Hills, Chatsworth, Panorama City, North Hills, Porter Ranch, Winnetka*

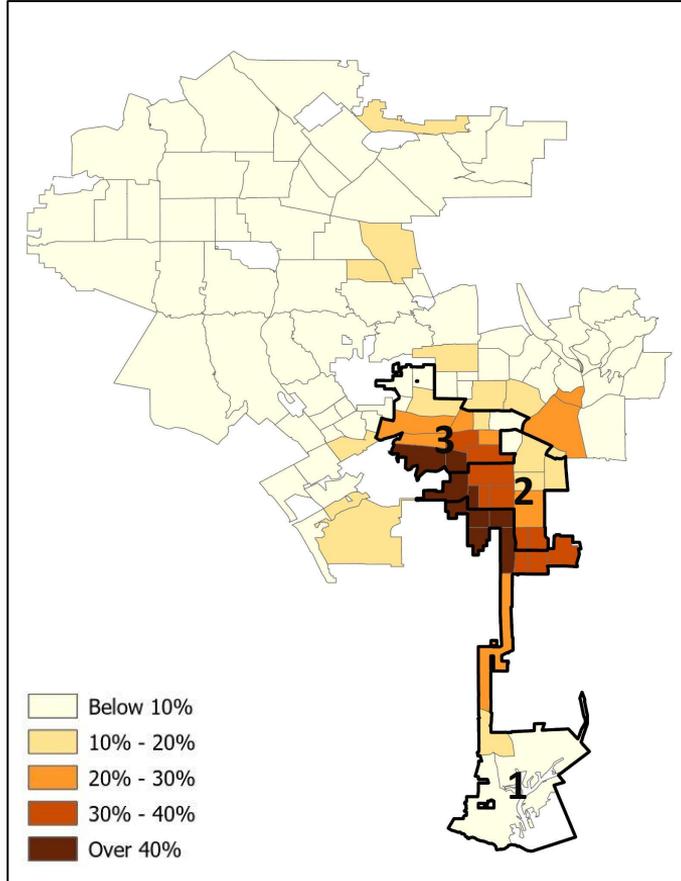

The following slide shows a map where we **manually drew three districts** to maximize **Black Citizen Voting Age Population (CVAP)**, while limiting neighborhood splits to **no more than three**. In addition, no district enters the Koreatown, Chinatown, Westgate, or Downtown neighborhoods.

Under a **Multi-Member District (MMD)** system, districts are larger but **each district elects three representatives**. Using the **Droop quota ($1 / [n + 1]$)**, a candidate needs only **25% of the vote** to be elected in a three-member district. We also define districts with **15%–25% CVAP** as **“influence” districts**.

Although these districts still include substantial Latino and/or White CVAP, **MMDs reduce winner-take-all dynamics**. Rather than a zero-sum contest, Multi-Member Districts create **meaningful opportunities for Black voters to elect candidates of choice**, even in diverse districts.

3	11%	27%	34%	27%	Adams-Normandie, Arlington Heights, Baldwin Hills/Crenshaw, Beverly Grove, Carthay, Exposition Park, Fairfax, Harvard Heights, Jefferson Park, Leimert Park, Mid-City, Mid-Wilshire, Pico-Union, West Adams

The following slide summarizes results from **10,000 randomly simulated maps** generated using **GerryChain**, showing the **average distribution of representation by race**.

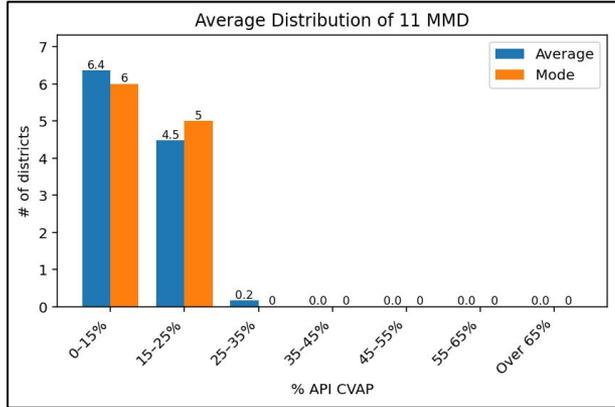

Applying our definitions—**25%+ CVAP as a “solid” seat** and **15%–25% CVAP as an “influence” seat**—the chart estimates **racial influence under a Multi-Member District (MMD) framework**.

Because these maps use **MMDs**, the **threshold to elect an AAPI or Black candidate is substantially lower**, providing these communities with **meaningfully greater opportunities to elect candidates of their choice**.

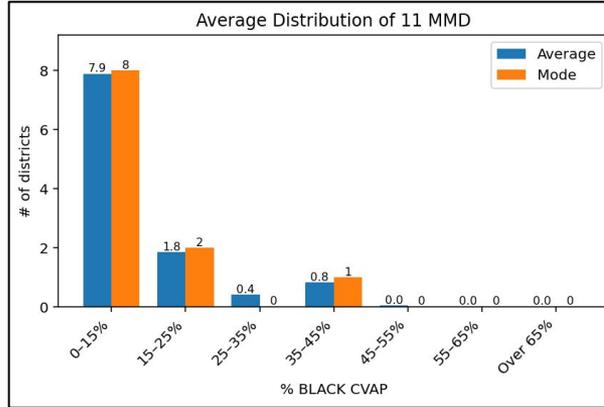

CVAP Distribution by Race: 11 MMD

ANALYSIS of 9 MMD (Multi-member districts)

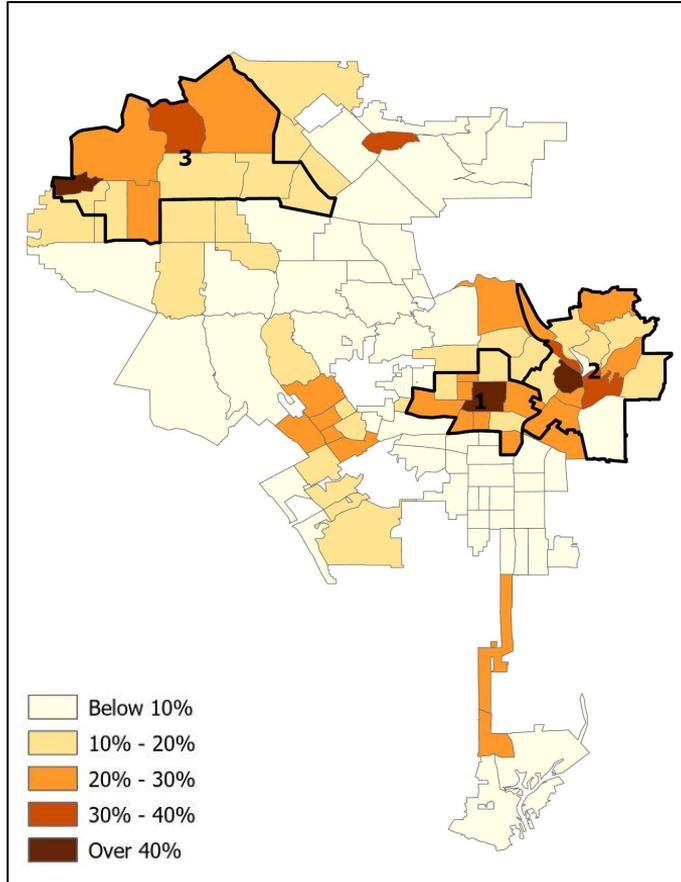

The following slide shows a map where we **manually drew three districts** to maximize **AAPI Citizen Voting Age Population (CVAP)**, while limiting neighborhood splits to **no more than one**.

Under a **Multi-Member District (MMD)** system, districts are larger but **each district elects three representatives**. Using the **Droop quota ($1 / [n + 1]$)**, a candidate needs only **25% of the vote** to be elected in a three-member district. We also define districts with **15%–25% CVAP** as **“influence” districts**.

Although these districts still include substantial Latino and/or White CVAP, **MMDs reduce winner-take-all dynamics**. Rather than a zero-sum contest, Multi-Member Districts create **meaningful opportunities for AAPI voters to elect candidates of choice**, even in diverse districts.

9 MMD: Maximum AAPI Representation

% AAPI CVAP by Neighborhood

	AAPI CVAP	Black CVAP	Latino CVAP	White CVAP	Neighborhoods <i>* Neighborhood is Split</i>
1	26%	11%	36%	26%	Koreatown, Mid-Wilshire, East Hollywood, University park, Pico-Union, Harvard Heights, Arlington Heights, Larchmont, Hancock Park, Windsor Square, Westlake*
2	19%	7%	50%	23%	Eagle Rock, Lincoln Heights, Highland Park, Chinatown, Echo Park, El Sereno, Montecito Heights, Glassell Park, Atwater Village, Boyle Heights, Elysian Valley, Mount Washington, Elysian park, Cypress Park, Downtown*, Westlake*
3	20%	6%	36%	37%	Northridge, Granada Hills, Chatsworth, Winnetka, Panorama City, North Hills, Porter Ranch, Canoga Park, Chatsworth Reservoir, West Hills*

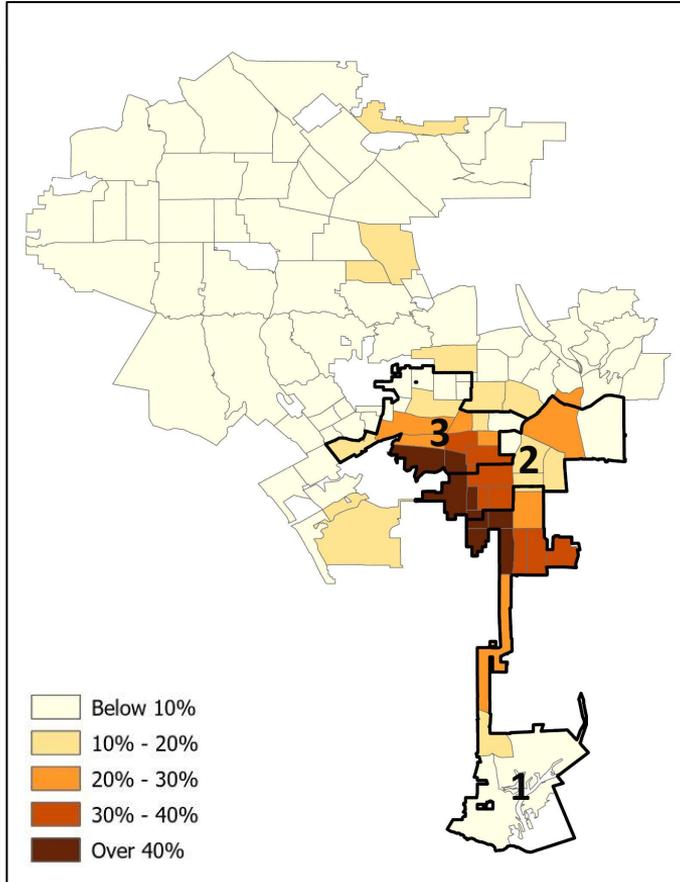

The following slide shows a map where we **manually drew three districts** to maximize **Black Citizen Voting Age Population (CVAP)**, while limiting neighborhood splits to **no more than three**. In addition, no district enters Koreatown, Chinatown, or Westgate neighborhoods.

Under a **Multi-Member District (MMD)** system, districts are larger but **each district elects three representatives**. Using the **Droop quota ($1 / [n + 1]$)**, a candidate needs only **25% of the vote** to be elected in a three-member district. We also define districts with **15%–25% CVAP** as **“influence” districts**.

Although these districts still include substantial Latino and/or White CVAP, **MMDs reduce winner-take-all dynamics**. Rather than a zero-sum contest, Multi-Member Districts create **meaningful opportunities for Black voters to elect candidates of choice**, even in diverse districts.

9 MMD: Maximum Black Representation

% Black CVAP by Neighborhood

Dist.	AAPI CVAP	Black CVAP	Latino CVAP	White CVAP	Neighborhoods <i>* Neighborhood is Split</i>
1	7%	25%	54%	14%	Broadway-Manchester, Florence, Gramercy Park, Green Meadows, Harbor City, Harbor Gateway, San Pedro, Vermont Knolls, Vermont Vista, Watts, Wilmington, Manchester Square*, South Park*
2	8%	24%	56%	11%	Boyle Heights, Central-Alameda, Chesterfield Square, Downtown, Harvard Park, Historic South-Central, Hyde Park, University Park, Vermont-Slauson, Vermont Square*, Manchester Square*, South Park*
3	13%	24%	30%	32%	Adams-Normandie, Arlington Heights, Baldwin Hills/Crenshaw, Beverly Grove, Carthay, Exposition Park, Fairfax, Hancock Park, Harvard Heights, Jefferson Park, Leimert Park, Mid-City, Mid-Wilshire, Palms, Pico-Union, West Adams, Windsor Square, Vermont Square*, Pico-Robertson*, Larchmont*

The following slide summarizes results from **10,000 randomly simulated maps** generated using **GerryChain**, showing the **average distribution of representation by race**.

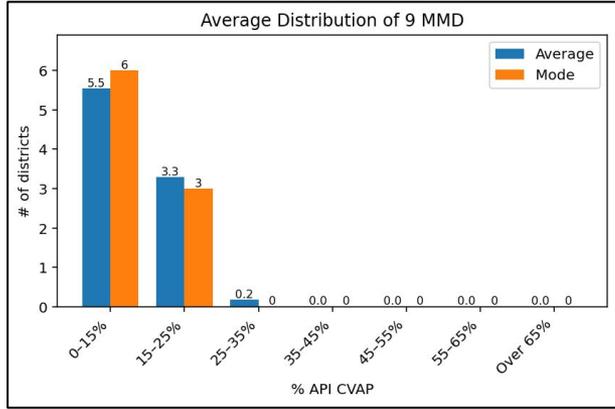

Applying our definitions—**25%+ CVAP as a “solid” seat** and **15%–25% CVAP as an “influence” seat**—the chart estimates **racial influence under a Multi-Member District (MMD) framework**.

Because these maps use **MMDs**, the **threshold to elect an AAPI or Black candidate is substantially lower**, providing these communities with **meaningfully greater opportunities to elect candidates of their choice**.
